The pathogenesis of Barrett's esophagus (BE) and its clinical sequelae, such as adenocarcinoma, are thought to involve specific genetic and epigenetic alterations. We investigated genomic DNA methylation in BE and adenocarcinoma (AC) for loss of 5-methylcytosine (5mC) and point mutations, and we quantified the expression of microRNA (miR)-9, -145, and -200a in BE and AC. The results showed that BE and AC display distinct alterations in promoter CpG methylation, genomic DNA 5mC, and the expression of miR-9, -145, and -200a. We hypothesize that distinct phenotypes may be generated by distinct combinations of epigenetic and genetic alterations, with a possible role of miRs in epithelial-mesenchymal transition. This invention relates to amplifiers and, more particularly, to a high frequency power amplifier (HPA) for use in a high frequency power transmission system. A signal to be transmitted between two locations often will be mod
