===== In the framework of

the International Committee for Mechanical Engineering (ICME) best practice recommendations, the present paper introduces the guide for the design of a collection of standard specimens for the measuring of frictional resistances between the tested surface and the testing surface.

The specimens are used to perform experiments for the standard evaluation of friction surfaces and other surfaces. The standard specimens consist of a

cylinder of an elastomer (polyurethane) bonded by its bottom to a plate made of stainless steel, with cylindrical chambers in the steel plate, and filled with a liquid (toluene) and marked to measure the friction coefficient. The steel plate presents an unevenness at the bottom, with an arrangement of drilled holes. The steel plate also is provided with a flat portion in order to allow the direct application of load in a

horizontal plane. This paper introduces in detail the geometrical characteristics of the standard specimens, and describes the experimental methodology for the measurements of the friction coefficients, which are performed by means of an apparatus based on force sensors. The guide is provided in three versions, in order to allow the adoption of one or more versions to match the application needs.

The guide is intended to be used by industrial research laboratories and testing centers which are planning to perform, in their laboratories, experimental tests on the determination of friction coefficients, by means of the standard specimen which are introduced in the paper. The report is organized as follows: the first section presents a description of the standard specimen, including the

definitions of the geometrical and dimensional characteristics.

The second section provides guidelines for the design of the experiment for the determination of the friction coefficient, discussing in detail the operative methodology. The third section provides the procedure to calculate the mean value of the friction coefficient. The last section presents the final version of the report, including the descriptions of the specimens,

the experimental methodology,
and the procedure for the
calculation of the mean value of
the friction coefficient

If we get a divorce, in which case can I count on alimony?" src="https://www.znak.com/2019-05-26/muzh_ne_nashel_s_zhenoy_podrugu_kak_yavitsja_ih_rebenok_v_protsesse_razvoda_na_znak_com" /> Hello. After the divorce, I was left with a 2-year-old child in my arms. My ex-wife and I haven't lived together for over a year. At the same time, according to the

documents, the child is on it. But I'm sure she doesn't bring him up and lives for her own pleasure.
