At the heart of these issues is the challenge of collecting, pooling, and understanding data on and from the devices and objects that make up the IoT. How can a business or organization assure that the data collected about its customers is secure? What are the best practices for ensuring privacy and security of data collected from the devices, or from which data is collected? How do IoT companies ensure that their customers' data is not compromised by hackers or cyber thieves? To illustrate the challenges associated with IoT, we have interviewed industry experts — who have helped a lot of companies make data secure, and who are facilitating a significant migration to IoT solutions. The experts' perspectives, and recommendations for companies and organizations that are planning an IoT strategy for their business, are described in the following blog posts: It's not just about security Most organizations that are embracing IoT understand the importance of securing the data they collect about their customers. The issue with many IoT solutions is that their only focus is on security. Consider the example of a current IoT solution: The solution collects data from, say, connected lights: illumination, motion, and so on. The data is transmitted to the IoT cloud. The IoT cloud consolidates the data, analyzes it, and makes it available to the connected lights (e.g., via a PLC controller). But the solution does not collect data about the operations and maintenance activities that are conducted on the lights. As a result, there is no data that helps companies understand how well, or how not-so-well, their connected lights are performing, and there is no way to perform operations and maintenance without tampering with the lights. Of course, IoT has the ba244e880a
