However, if you right-click on the icon you can select "open file location" in which you can then find the.pdb file. Additionally, you can copy the.pdb file to another location and use the command line CMD/Command Prompt to run the PDB_XML command to create the access file. This will allow you to save the file without the "extension". Update: If you are trying to open the.pdb file with a 3rd party application, you need to have the same application as the one that you used to open the.pdb file. That's pretty much the point of using a.pdb file. If you were to change the name of the file to something else, it would only open the.pdb file in the viewer that you were using to create it. See my comments in the other answer that is still up. US President Donald Trump has signed a new executive order on immigration. It will roll back former President Obama's guidelines that have defined the criteria for deportation to those convicted of crimes that are "serious" and "violent." Trump's new guidelines would protect from deportation immigrants convicted of minor crimes, like those considered "low-level" crimes, the Associated Press reported. More than 2 million immigrants have been deported in the last year alone, and Trump's executive order aims to reduce that number by giving Immigration and Customs Enforcement (ICE) officials more discretion in who to deport. "To target those convicted of serious crimes is a policy that prioritizes people based on how much pain they've caused our fellow Americans," the president's new guidelines say, according to the AP. "To target all removable aliens in this

Batch file that updates date I have a batch file that can update a file. This is the file: set file=c:\test\update.txt set /a offset=0 (for /f "usebackq delims=" %%a in ("%file%") do (set "file2=%%a" set /a offset=offset+1 setlocal enableDelayedExpansion set /a num=!file!.!offset! if !num! GTR 14 (endlocal & set /a offset=offset+1 echo %%a) else (set /a offset=offset+1 set /a num=!num!+1 echo %%a)) What I want to do is to update the date on the file so it always has the most recent date. I'm not sure how to do that. Any ideas? A: You can use: for /f %%a in (date /t) do set dd=%%a Controlled delivery of rhenium-186 and iodine-125 from alkyl-diamine-tin(II)-oleyl-phosphoramidate bifunctional chelating agents. Chelating agents that are comprised of reactive or unreactive components can be used to bind metals selectively in the body. They can then be used to deliver radionuclides specifically to the desired organ. Using this concept, we have synthesized a family of chelating agents and then shown that these agents can selectively deliver radiolabeled Re-186 and I-125 to tumors in mice. In a series of studies, stability constants (log beta(X)) of alkyl-diamine-tin(II) chelate of oleyl-phosphoramidate (IDAOPA) derivatives were determined. The log 2d92ce491b
