One hundred and forty workers from a production line producing a special salt for fish and fish products were studied to assess the prevalence and incidence of respiratory tract infection (RTI). They were followed for at least one year. They were studied before beginning the production, and at 1, 6, 12 and 24 months after the beginning of the production. The infectious agents included influenza virus, adenovirus, Mycoplasma pneumoniae and Chlamydia pneumoniae, and also, cases of parainfluenza virus infection (PIV) and rhinovirus infection (RVI). The prevalence of RTI in the studied population increased from 30% 2d92ce491b
