Classical, lightweight and portable deployment that can be stored on flash drives Carefully chosen audience survey research (CASR) involves collecting information from a small number of random individuals. In the right context, this research method can provide you with useful insights that you wouldn't obtain through other means. Based on data from those individuals, you can draw conclusions about the population as a whole. If you're interested in applying this research method, you'll need to know a few things first. What is CASR? CASR is a form of market research, used mostly by larger brands looking to measure consumer insights. This method of research involves surveying a sample of people that meet certain criteria. For example, your brand might survey a group of younger adults in order to see what they think about a new product. How CASR Works The sample must be selected at random to ensure that the results can be generalized to the population. After they've been selected, the people in the sample are surveyed about their lifestyles, attitudes, purchase behaviors, and more. Why CASR is Important CASR allows you to examine "the things that are forgotten or ignored" by conventional research methods, such as questionnaires. It can also uncover nuances that no other means of research can. This approach can reveal insights into a brand's customer base that you simply can't get from questionnaire data alone. The Pitfalls of CASR Unlike others, CASR doesn't rely on a pre-existing sample of people. Thus, your study must be well-designed in order to get solid results. There are a few things you should take into account before using CASR: •

Ask the right questions: You'll need to ensure that the questions you ask are in line with the research you want to conduct. Additionally, you'll need to ask other questions that will allow you to classify your sample population. • Keep in mind cultural nuances: If you want to collect information from a particular cultural background, then you need to take cultural factors into consideration. This might affect the way your sample is perceived, and the information you collect. • Control for bias: It's impossible to observe things like visual acuity in individuals without some type of bias, so it's necessary to have a good control group to ensure you're interpreting the results correctly. How to Pick a Sample There are several factors to consider when choosing a sample for a survey. To ensure your sample is representative of the population, you
