We retrospectively analyzed the results of a pilot project of high- and low-dose litholysis in patients with large upper and lower pole cystic calculi to identify the therapeutic efficacy and risk of enucleation. In six patients, the stones measured 5 to 22 cm. In one patient with a 23-cm stone, a second high-dose session was performed after 15 months. Of 14 patients with lower pole stones, 9 (64%) were asymptomatic and 5 (36%) had a reduced stone burden. In six patients with upper pole stones, 3 (50%) were asymptomatic and 3 (50%) had reduced stone burden. Of the 17 patients treated, 13 (76%) were asymptomatic at last follow-up, 3 (18%) had persistent stone disease, and 1 (6%) required an emergency open nephrolithotomy. On the basis of these preliminary results, we conclude that high-dose litholysis seems to be a feasible and safe treatment for certain patients with large cystic renal calculi.Q: Parsing line data from Microsoft Azure I am attempting to gather data on the SQL Azure instance used by an Azure job I created. I have access to the job's data, and access to the data on the Azure instance that the job is running on. I have begun working with the data from the instance, however the data returned is not in a format I am familiar with. Data being returned by the instance from a select statement looks like this: fh\_path\_month/fh\_path\_month\_year/run\_status/job\_name/deployment\_target/log\_file\_name/log\_file\_name\_begin/run\_name/run\_date/run\_time/run\_duration/run\_status\_code\_time/run\_duration\_code/run\_result\_code/run\_result\_code\_time/run
