Data Access (DDX) The Data Access (DDX) API provides COM interfaces to read and write the database content from within an AutoCAD project. Data Access has had 3 successive versions since its introduction in AutoCAD 2009 (version 11.0) Version 1: The original version was called "DDX Application Programming Interface (API)" and it allowed applications to query the database for information within an AutoCAD project. This component was not necessary for database data to be accessed. Version 2: The second version of the data access interfaces was added in AutoCAD 2010 and was named "AutoCAD Dynamic Data Exchange". The first version was a template, and the second version contained the necessary data. Version 3: The third version of the Data Access interfaces was added in AutoCAD 2012 and was named "AutoCAD Database Development Environment (DDX)" and replaced the "AutoCAD Dynamic Data Exchange" component. The data access component is a template again, so the data is available to any applications that want it. The AutoCAD Database Development Environment uses the Autodesk DDLT. If you use the Data Access component to write to a database, you can also use the Autodesk DDLT tool to read that data back into the project. Debugging One of AutoCAD's primary functions is to provide rapid debugging functionality. This is achieved by offering tools to connect to a file, execute it, and pause the execution of the file at any point. To assist in the rapid debugging of a program, AutoCAD also provides a graphical, object-oriented programming language known as Visual LISP. Visual LISP is an interpreted language, which means it reads and interprets the Visual LISP source file as it executes. Visual LISP provides many features for controlling the execution of a program. Visual LISP is similar to C++ and Visual Basic and is used for a wide range of programming tasks including error handling, exceptions, registering callback functions and the running of various event procedures. Windows services AutoCAD can host a Windows service that offers access to the APIs mentioned above. This is primarily used for automation purposes and to speed up processes when a program is running in the background. The Windows Service allows commands to be sent to the application without the user needing to be logged on. There are 2 types of Windows Services: Windows services execute on a personal computer AutoCAD on Windows Server executes a1d647c40b
