It is interesting to note that of the barriers to attending for HIV testing, the higher rate of stigma and embarrassment was only reported by pregnant women. This could be due to stigma being a greater issue in pregnancy. This could also explain the low uptake of HIV testing in the postnatal period when the mothers would be likely to be less well supported by partners and other family members. The low uptake of HIV testing by

young pregnant women was not surprising considering the reported low rates of uptake of HIV testing in the general population. In 2012, the Government of Malawi, amongst other countries, set the goal of 90 % of all pregnant women accessing HIV testing at the time of their first antenatal visit \[[@CR7]\]. However, only 17 % of pregnant women in this study accessed HIV testing during their first antenatal visit. This is much lower than the 50 % rate of HIV testing in the general Malawian

population \[[@CR8]\], although it is similar to the rate of testing in an antenatal population in the UK \[[@CR17]\]. Our study showed that HIV testing during pregnancy in urban Malawi was associated with higher uptake of HIV testing after delivery. This was also the case in a previous study in rural Malawi \[[@CR13]\]. This suggests that there are potentially more opportunities in urban settings than rural settings to promote uptake of HIV testing during pregnancy, in particular when mothers are

accessing antenatal care. In this study we found that uptake of HIV testing was associated with antenatal care attendance. This is consistent with previous studies \[[@CR3], [@CR18]\] and highlights the important role of antenatal care for the promotion of uptake of HIV testing. It has previously been reported that having an HIV test is associated with high acceptance of an HIV test in the future, even after the results of the first HIV test are known \[[@CR19]\]. This suggests

that an HIV-negative result from an initial HIV test may not automatically translate to a low risk of HIV in the future, and suggests that HIV-negative women may benefit from future

takes an ontology URI (ex: and returns an OWL module in RDFS syntax If you are using a HTTP server, you can just use the URI to see what the program returns. You can change the url to the URI of any ontology. The output of the

extraction is saved into your output directory. Can be used to import ontologies into a local version of Ontoware, Kowledge, etc.

Q: How to wait until a certain file exists?

What I want to do is to have a piece of code that checks if the file my_input.txt exists. If it does exist then the whole program is done, if it doesn't exist then the program should run until it does. I know how to use if-else statements but what I'm looking for is something like:

while Not exists_my_input.txt() do Do some

stuff. end My goal is that if I change the name of my_input.txt to a string with no characters in it then it should still run. A: You can use the filelib module. You could do: import filelib file_check = filelib.File("my_input.txt") if file_check.exists(): do_something_with(file_check) else: print "File not found" while 1: file_check.update() Note: This will not continue if a new version of the file is created. If you want to check to see if the file is current then you will need to use the other method.

Also note that if you are accessing the file with full path then this method will not work. If the file is accessed by relative path then it will. OWL-ME is a free command-line tool for extracting OWL modules from ontology URIs. The tool can be used to extract modules from ontology files using OWL-DL as the ontology representation format. The tool accepts ontology URIs in the OWL-DL format. Its command-line interface allows the specification of location for the output of the modules, making it easy to create scripts or to transfer the module(s) to another location.
