I am doing this for encryption so I need to check these conditions. So how can I do this? I am new to plain C. A: Use a table with bit masks. You can use bit masks to store multiple values (for example, only '0' or '1') in a single byte. For example, the highest value bit mask for an 8-bit value is: 0b111111 (decimal 217 = 128) Therefore, you can use that as an index into a bitmask for a byte. So, for an 8-bit value, you can use a table like this: typedef enum { value0 = 0b0000, value1 = 0b0001, value2 = 0b0010, value3 = 0b0100, value4 = 0b1000, value5 = 0b1100, value6 = 0b1000, value7 = 0b1110 } value8_bit_t; Now, you can use this table to get the bit mask for a byte. This is known as a bit mask because it takes a 5b5f913d15

Treatment for distal ureteral stones: use of the T-Flex Ureteral Access Sheath. To evaluate the efficacy of the T-Flex ureteral access sheath in the treatment of distal ureteral stones. This study was a retrospective analysis of consecutive patients with distal ureteral stones who underwent flexible ureterorenoscopy (f-URS) with the T-Flex ureteral access sheath (URS-T) from September 2012 to September 2014. The characteristics of the patients and stones, clinical success, renal function and complications were investigated. A total of 111 patients (141 ureters) with distal ureteral stones (mean stone size, 9.0 mm) underwent f-URS with the URS-T. The mean follow-up period was 22.8 months (range, 6-51 months). The stone-free rate was 97.9% (138 of 141 ureters). The mean hospitalization time was 1.7 days (range, 1-7 days). The patients' overall success rate was 91.8% (113 of 123 ureters). The overall complication rate was 8.1% (10 of 123 ureters). The patients who had a single session had significantly higher success rates than those who underwent multiple sessions (P 1.
