It is concluded that the depression in egg production observed in selenium-deficient laying hens was not a direct consequence of decreased eggshell thickness.Q: How to dynamically set a variable to a placeholder I have an answer file (apart from the main one) in which I would like to be able to have a certain variable set as the placeholder for the placeholder. For example: And in response.js I have: var f = [[]] For example, if I want to set a variable called status as the placeholder for a number of elements, I would like the following to occur: var f = [[status]] Which I can then display, for example, with the following: document.getElementById('some-id').innerHTML = f; But how do I pass the variable into the script tag and then make it the placeholder? A: You can use a variable declared within the.js file. I am not sure why you have this written in a script tag. So create a js file called something like this: var f = null; and within it use the following: var f = [[f]] What this does is pass the variable as a reference to the script. The Delhi Police said

These days, our focus tends to go towards PC specifications, but if you're building a new PC, I'd definitely recommend grabbing the Ryzen 7 1800X.
